

## Where Some Materialistic Scientists Have Gone Wrong

Himangsu S. Pal\*

### ABSTRACT

In this essay, I argue that there are at least three cases where some materialistic scientists have gone wrong so far.

**Key Words:** Materialistic, science, God, Universe, something, nothing.

I think there are at least three cases where some materialistic scientists have gone wrong so far.

The first case is that physicists have found that the total energy of our present Universe is possibly zero. On the basis of this fact they have concluded that the entire Universe has originated from nothing. But this is possibly a wrong conclusion, because I have already shown [1] that the total energy of the Universe would also be zero even if it has originated from something and not from nothing. So zero total energy cannot be the only criterion on the basis of which one can conclude that the Universe has originated from nothing.

The second case is that, although some scientists have argued or deduced that the total matter and the total energy of the Universe is zero, they have not yet shown as to how the total space and the total time of the present Universe also remain zero. This is one major drawback in their theory that the Universe has originated from nothing. And, if this theory cannot explain as to how the total space-time of the Universe also remains zero, then these materialistic scientists will not be able to convince us that Universe's origin from nothing is actually the case.

Indeed, if we take it for granted that the Universe has originated from nothing, then not only its total matter and energy but its total space-time as well have also originated from nothing. So not only its total matter and energy, but its total space-time also should always remain zero, because space, time, matter and energy, all the four of them, have originated from nothing. Something can come out of nothing provided that the totality of that something always remains zero. So total space, total time, total matter and total energy of our present Universe must always remain zero, if it is claimed that the Universe has originated from nothing.

The third case is that some scientists have jumped to the conclusion that something is coming out of nothing, which means that something can actually come out of nothing, based on the argument that virtual particles exist in a quantum vacuum. They have further concluded that the entire Universe has also come out of nothing due to the quantum energy fluctuation in a void. But this conclusion may not be a sound one, because first of all it will have to be ascertained as to whether the void is a real void or not. The void is within the Universe and not outside of it.

If there is a God, then that God is omnipresent, everywhere. So, if there is a God, then the void created within the Universe will not be a real void at all, because in that case God will be present within the void itself. In case there is no God, then only it can be said with certainty that the void is a real void. So first of all it will have to be established that there is no God. Without establishing this point first if these scientists want to proceed further, then all their conjectures, and all their conclusions based on those conjectures, might be proved wrong if ultimately it is found that there is a God. And to prove that there is no God it is necessary to show that there is no hand of God behind the creation event. That means materialistic scientists will have to give a natural explanation for the origin of the Universe. If this explanation can be given, then it will show once and for all that there is no God. And it will also show once and for all that the void is a real void. This is because if there is a God, then definitely this Universe will be his creation.

But instead of doing this first thing first, materialistic scientists have already presupposed that there is no God when they have concluded that the void is a real void. Then based on this presupposition that there is no God they have shown that no God is actually needed for creating the Universe, because it can naturally arise out of nothing due to the quantum energy fluctuation in a void. Therefore, this is nothing but a pure case of circular reasoning. This point has already been discussed in [2].
